

Tracking High-Value Assets with On-Metal and Other Durable RFID Tags

OVERVIEW

Problem

**Unaccounted or
Untraceable Assets**

Background

**Extensive Infrastructure
and Regulatory
Environments**

Solution

**Highly-Adaptive
RFID Tagging**

Does your company or institution have numerous assets such as laptops, servers, equipment racks, handheld computers, high-value tools, and other hardware? Is it difficult to keep track of these assets? Where are they? Who has which asset? Does an asset or asset class need to be serviced or replaced? Do assets mysteriously go missing?

PROBLEM

Unaccounted or Untraceable Assets

For large companies and institutions, getting clear answers to these questions has traditionally been difficult, time-consuming, costly, and error-prone. Often, an entire team may need to devote overtime just to gather all of this data. This is an expensive practice, and usually not very popular with employees. Even with overtime projects to locate

and identify assets, many assets often remain unaccounted for because of basic human errors in the process.

Another problem that organizations face when attempting to track assets with a barcode-based system is that assets will be accounted for at the beginning of the process then get lost later down the line. Although most large organizations have barcode systems in place to initially register or check-out assets, when the time comes for users to find an asset to scan the barcode, the object's location is unknown. This is the classic "Catch 22" of barcode-based asset tracking systems.

BACKGROUND

Extensive Infrastructure and Regulatory Environments

A typical large enterprise, government entity, or school district can have thousands of laptops, projectors, servers, tools, and other high-value assets that need to be monitored. Such assets, whether stationary or portable, need to be accounted for.

In these particular environments, budgets can be limited and heavily regulated. A typical school district, for example, must operate within a tightly controlled budget, and any shrinkage of their assets can have dire consequences. Taking preventive measures to invest in asset tracking and labeling technology will save your organization time and money because the cost of missing an asset can have serious negative impacts on your business processes. For example, a missing tool can completely stop an assembly process and be costly in terms of downtime spent trying to relocate the tool or in replacement costs for a lost tool.

In these particular environments, budgets can be limited and heavily regulated. A typical school district, for example, must operate within a tightly controlled budget, and any missing assets can have dire consequences. Taking preventive measures to invest in asset tracking and RFID labeling technology will save your organization time and money. The cost of a missing asset not only needs to be accounted for in the budget, it can also have serious negative impacts on business processes. A missing tool or IT asset can completely stop an assembly process, for example. Trying to locate or replace the asset takes time and money.

“With the T6000e and T4000 enterprise RFID printers, users can easily swap out very different media types to print and encode labels used for asset tracking according to the needs of their business”

SOLUTION

Highly-Adaptive RFID Tagging

By tagging these assets with RFID tags, users can quickly locate and track assets with a significantly higher degree of accuracy than the process of manually scanning barcodes. Not to mention, this eliminates the need for late shifts and large amounts of labor needed to track down and document every tool and asset within a facility.

Once the items are tagged, RFID readers at various locations can then identify every asset and tie the data into the company’s main software systems. Reading the tags can either be an automated process, occurring at pre-defined intervals, or on-demand. The RFID readers can be fixed at various locations and chokepoints, which allow an asset’s movement to be tracked. The on-demand option for asset tracking using RFID tags involves using handheld devices to locate and identify individual assets or the contents within an entire pallet of assets.

The tags used for such asset tracking processes usually also have printed information on their label. This is intentional, and the printed data serves as a backup record to the RFID processes. This is similar to how a barcode label’s user-readable portion serves as a backup to the barcode’s bars and spaces.

RECOMMENDATION

The Award-Winning T6000e and T4000 Series RFID Printers

The T6000e and T4000 RFID series printers part of our Printronix Auto ID enterprise line are used extensively by service bureaus and other large entities for asset tracking applications. Service bureaus can pre-print and pre-encode the tags in large volumes, ship the tags to the user, and then the association between the tags and assets is done on-site by the user. Alternatively, the printing, encoding, and association can all be done together directly on-site by the user.

The T6000e and T4000 were designed from the ground up to work with a wide variety of RFID tags. Given that assets can vary in terms of size, construction, and physical form, different tag types are often needed for different asset classes. An on-metal tag might be the best solution for laptops, whereas a very small label might be needed for a handheld barcode scanner. Both the T6000e and T4000 RFID printers, give users the ability to work with a wide range of different tags. From a single printer without any complex changes, to thick on-metal tags, very small tags, to plasticized Returnable Transport Item (RTI) tags, our RFID printers can handle them all.

“With the T6000e and T4000 enterprise RFID printers, users can easily swap out very different media types to print and encode labels used for asset tracking according to the needs of their business,” said Chris Brown, RFID Subject Matter Expert for TSC Printronix Auto ID.

Printronix Auto ID RFID-enabled printers have been tested and validated with many tags used in asset tracking, including on-metal tags, RTI tags, flag tags, and a variety of other tag constructions. For listings of tags validated for use with Printronix RFID enabled printers, please refer to: Tested inlays and off-metal tags and Tested on-metal tags.

CONCLUSION

TSC Printronix Auto ID RFID Printers to Support All of Your Asset Tracking Needs

Printronix Auto ID RFID-enabled printers can handle both the wide variety and high volume of tags needed for asset tracking. Whether you run a service bureau and provide the tags to your customers, or you want to print and encode the tags in-house for your own asset tracking and identification, our RFID printers are up to the task.
